

Multi-Stage Planning Component

External Tools

Stage 1: Retrieval Planning

The planner formulates an initial retrieval strategy and triggers document acquisition via external tools.

Stage 2: NLP Analysis Planning

The planner determines which downstream NLP Analysis modules (sentiment analysis per document or grouped sentiment, topic modelling,...) should be executed

Stage 3: Document Selection Planning

Based on retrieved candidates, the planner reasons about relevance, diversity and temporal coverage to narrow the document set.

Stage 4: Summarize and Group Articles

Planner groups articles by year/date and summarizes articles for the final answer

Note to Planning Stages:

Every planning stage is executed in it's corresponding Layer.
CorpusAgent does not plan everything beforehand, this is to visualize the steps.
